

ENEL SpA

Capital Markets & Treasury Risk Management Update — 2026

POC TEST DOCUMENT — SYNTHETIC DATA

Created specifically to test the ING Financial Markets AI Agentic Platform. This is not an authentic Enel disclosure.

1. Refinancing Profile

Enel SpA is reviewing its medium-term refinancing programme in light of a concentrated debt maturity profile across late 2026 and 2027. Approximately **€10.13bn** of debt is identified as maturing over this period. The treasury team is assessing refinancing sequencing and potential pre-hedging requirements before the relevant maturity dates.

2. Funding Authorisation

The Board has authorised up to **€12.0bn** of financing capacity through March 2027. The authorisation is intended to support upcoming maturities, liquidity requirements and planned renewable-energy capital expenditure.

3. Existing Coupon and Repricing Exposure

A portion of the existing debt ladder carries a legacy fixed coupon of approximately **1.20%**. Current indicative refinancing yields in this test scenario are assumed to be in the **4.5%–5.0%** range. This creates a material potential increase in financing cost when legacy debt is refinanced.

4. Recent Funding Activity

A hypothetical **\$2.5bn multi-tranche USD bond** transaction in July 2026 is included as a test scenario. It addresses immediate funding requirements but does not eliminate the remaining 2026–2027 maturity concentration.

5. Foreign Exchange and Commodity Exposure

The treasury team is also reviewing USD-linked procurement and foreign-exchange exposures associated with energy and fuel purchases. A strengthening USD against EUR could increase the EUR cost of USD-denominated procurement. Commodity-price volatility may further affect operating cash flows.

6. Potential Treasury Actions Under Review

The following actions are being evaluated for this synthetic scenario:

Area	Potential action
Interest Rate	Review forward-starting or pre-hedging interest-rate swap requirements before major maturities.
Funding	Assess refinancing sequencing across the €10.13bn maturity wall and available €12.0bn authorisation.
FX	Evaluate hedging of USD-denominated fuel and procurement exposures.
Cross-Asset	Assess whether refinancing, rates and commodity/FX risks should be coordinated.

7. Treasury Coverage Trigger

The combination of a **€10.13bn debt maturity wall**, **€12.0bn funding authorisation**, a **1.20% legacy coupon**, higher indicative refinancing yields, and potential USD procurement exposure represents a multi-channel treasury coverage trigger for this POC.

The intended test outcome is for the AI system to identify Interest Rate and Financing/Capital Markets as primary opportunity areas, while considering FX and Cross-Asset opportunities as conditional areas for further qualification.
